

ABSTRACT OF THE DISCLOSURE

When a plurality of image communication apparatuses, especially digital cameras, communicate images, each of the users of the receiving digital cameras can pull desired images from an image transmitting camera. In an image communicating method in which an image can be communicated by wireless in a server-client system, an image is displayed on a server camera, and an image is selected from among displayed images for transmission to a client camera. Pressing of the release button of the client camera instructs the client camera to transmit to the server camera a request to send an image to the server camera. The client camera transmits the request to send an image to the server camera. The server camera transmits the selected image to the client camera. Thus, the user of the client camera can obtain a desired image from the server camera.
